We consider the problem of query optimization in the presence of limitations on access patterns to the data (i.e., when one must provide values for one of the attributes of a relation in order to obtain tuples). We show that in the presence of limited access patterns we must search a space of annotated query plans, where the annotations describe the inputs that must be given to the plan. We describe a theoretical and experimental analysis of the resulting search space and a ...

Virtually every commercial query optimizer chooses the best plan for a query using a cost model that relies heavily on accurate cardinality estimation. Cardinality estimation errors can occur due to the use of inaccurate statistics, invalid assumptions about attribute independence, parameter markers, and so on. Cardinality estimation errors may cause the optimizer to choose a sub-optimal plan. We present an approach to query processing that is extremely robust because it is able to detect and re ...

We present the design of ObjectGlobe, a distributed and open query processor for Internet data sources. Today, data is published on the Internet via Web servers which have, if at all, very localized query processing capabilities. The goal of the ObjectGlobe project is to establish an open marketplace in which *data* and *query processing capabilities* can be distributed and used by any kind of Internet application. Furthermore, ObjectGlobe integrates *cycle providers* (i.e., machi ...

### 1 [Query evaluation techniques for large databases](#)

Goetz Graefe

 June 1993 **ACM Computing Surveys (CSUR)**, Volume 25 Issue 2

Publisher: ACM Press

 Full text available: [pdf\(9.37 MB\)](#)

 Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#), [review](#)

Database management systems will continue to manage large data volumes. Thus, efficient algorithms for accessing and manipulating large sets and sequences will be required to provide acceptable performance. The advent of object-oriented and extensible database systems will not solve this problem. On the contrary, modern data models exacerbate the problem: In order to manipulate large sets of complex objects as efficiently as today's database systems manipulate simple records, query-processi ...

### 2 [Consistent selectivity estimation via maximum entropy](#)

V. Markl, P. J. Haas, M. Kutsch, N. Megiddo, U. Srivastava, T. M. Tran

 October 2006 **The VLDB Journal — The International Journal on Very Large Data**
**Bases**, Volume 16 Issue 1

Publisher: Springer-Verlag New York, Inc.

 Full text available: [pdf\(737.08 KB\)](#)

 Additional Information: [full citation](#), [abstract](#), [index terms](#)

Cost-based query optimizers need to estimate the selectivity of conjunctive predicates when comparing alternative query execution plans. To this end, advanced optimizers use multivariate statistics to improve information about the joint distribution of attribute values in a table. The joint distribution for all columns is almost always too large to store completely, and the resulting use of partial distribution information raises the possibility that multiple, non-equivalent selectivity estimate ...

# 1 [Efficient mid-query re-optimization of sub-optimal query execution plans](#)

Navin Kabra, David J. DeWitt

June 1998 **ACM SIGMOD Record , Proceedings of the 1998 ACM SIGMOD international conference on Management of data SIGMOD '98**, Volume 27 Issue 2

Publisher: ACM Press

Full text available: pdf(1.83 MB)

Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

For a number of reasons, even the best query optimizers can very often produce sub-optimal query execution plans, leading to a significant degradation of performance. This is especially true in databases used for complex decision support queries and/or object-relational databases. In this paper, we describe an algorithm that detects sub-optimality of a query execution plan during query execution and attempts to correct the problem. The basic idea is to collect statistics at key points durin ...

### 1 [Description logics for semantic query optimization in object-oriented database](#)

[systems](#)

Domenico Beneventano, Sonia Bergamaschi, Claudio Sartori

 March 2003 **ACM Transactions on Database Systems (TODS)**, Volume 28 Issue 1

Publisher: ACM Press

 Full text available: [pdf\(406.56 KB\)](#)

 Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

Semantic query optimization uses semantic knowledge (i.e., integrity constraints) to transform a query into an equivalent one that may be answered more efficiently. This article proposes a general method for semantic query optimization in the framework of Object-Oriented Database Systems. The method is effective for a large class of queries, including conjunctive recursive queries expressed with regular path expressions and is based on three ingredients. The first is a Description Logic, ODL

**Keywords:** Semantic query optimization, description logics, integrity constraints rules, query rewriting method, semantic expansion of a query, subsumption

### 2 [Logic-based approach to semantic query optimization](#)

Upen S. Chakravarthy, John Grant, Jack Minker

 June 1990 **ACM Transactions on Database Systems (TODS)**, Volume 15 Issue 2

Publisher: ACM Press

 Full text available: [pdf\(3.46 MB\)](#)

 Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

The purpose of semantic query optimization is to use semantic knowledge (e.g., integrity constraints) for transforming a query into a form that may be answered more efficiently than the original version. In several previous papers we described and proved the correctness of a method for semantic query optimization in deductive databases couched in first-order logic. This paper consolidates the major results of these papers emphasizing the techniques and their applicability for optimizing rel ...

### 3 [Query optimization in XML structured-document databases](#)

Edit an existing query or  
compose a new query in the  
Search Query Display.

## Search Query Display

Select a search number (#)  
to:

- Add a query to the Search Query Display
- Combine search queries using AND, OR, or NOT
- Delete a search
- Run a search

## Recent Search Queries

- |            |   |
|------------|---|
| <u>#1</u>  | ((~query optimization~~ or ~query execution plan~~<in>metadata)   |
| <u>#2</u>  | (( query optimization or query execution plan )<in>metadata) and ~constraint rules~~  |
| <u>#3</u>  | (~~derived constraint rules~~<IN>metadata)  |
| <u>#4</u>  | (derived and constraint and rules<IN>metadata)  |
| <u>#5</u>  | (derived and constraint and rules<in>metadata) and query and execution and plans  |
| <u>#6</u>  | (derived and constraint and rules<in>metadata) and (qep or ( query and optimization ) or ( query and execution and plans))              |
| <u>#7</u>  | (derived and constraint and rules<in>metadata) and (qep or ( query and optimization ) or ( query and execution and plans))              |
| <u>#8</u>  | (derived and constraint and rules<in>metadata) and (qep or ( query and optimization ) or ( query and execution and plans))              |
| <u>#9</u>  | 8 and tables and columns and ((primary and foreign) and keys)   |
| <u>#10</u> | ((primary and foreign) and keys and constraints<IN>metadata)  |
| <u>#11</u> | (derived and constraint and rules<IN>metadata)  |
| <u>#12</u> | ((((derived and constraint and rules<in>metadata))<AND>(derived and constraint and rules<in>metadata) and query and execution and plan) |
